

Northview Invitational -- Astronomy

15 December 2012

Team Name: _____

Team #: _____

***Instructions:** Using resources as outlined in the 2013 rules, answer the following questions. If the answer asks for a number, you must include appropriate units to be granted credit. In addition, your answer must be in one of the unit(s)--or a reasonable multiple, e.g. pc,kpc,Mpc;m/s, km/s--requested. **Show your work!** Partial credit will be given for proper procedures.*

You might find the following useful.

Data for the Sun

Mass $\approx 2 \times 10^{30}$ kg

Radius $\approx 7 \times 10^5$ km

Luminosity $\approx 3.8 \times 10^{26}$ W

Temperature = 5778 K

Spectral Type = G2V

Absolute V band magnitude $M_V = 4.83$

B-V color = 0.66

Other Information

1 Astronomical Unit $\approx 1.5 \times 10^8$ km

Hubble's Constant ≈ 73 (km/sec)/Mpc

Stefan-Boltzmann constant = $\sigma = 5.67 \times 10^{-8}$ J s⁻¹ m⁻² K⁻⁴

Score: _____/100

1. The following questions refer to the image below.

- a. Identify the star found in the left of this image: _____ (2)
- b. What larger structure is this star associated with? _____ (2)
- c. This star has a parallax angle of 5.89 mas. What is the distance to the star? (*pc OR ly OR m*)(3)

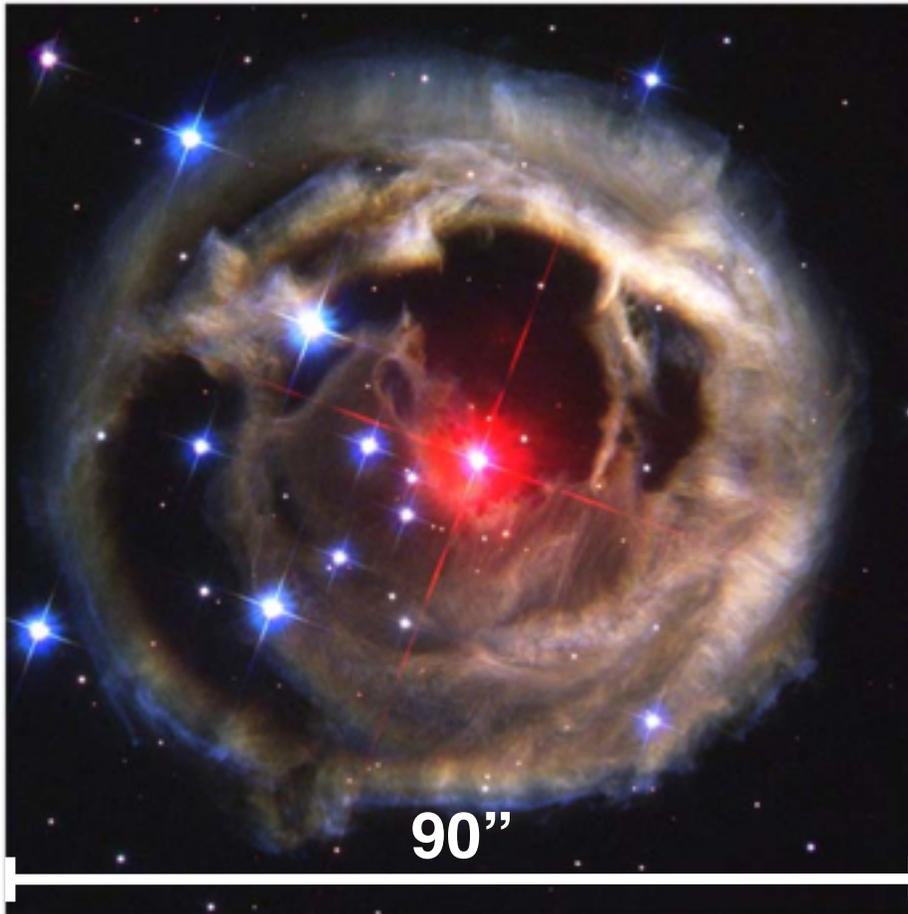

d. This star is actually two stars. This table gives the properties of the stars.

| | A | B |
|--------------------|------------------|----------------|
| Mass | 12.4 M_{\odot} | 10 M_{\odot} |
| Radius | 883 R_{\odot} | 4 R_{\odot} |
| Temperature | 3400 K | 18500 K |

Calculate the luminosities of the two stars. (L_{\odot} OR W) (4)

e. The estimated physical separation between the two stars is 574 AU. Estimate an orbital period from this information. (*years OR seconds*) (4)

2. The following questions refer to the image below.

- a. Name this object: _____ (3)
- b. The image above was taken on 17 December 2002, and shows the light echo from the outburst of the star. If the outburst began on 6 January 2002, estimate the distance to this object using the fact that the image is ~ 90 arcsec on a side. (*pc OR ly OR m*) (12)

Short Answer (2 points each)

- a. The final stage of evolution for a star like the Sun is a _____.
- b. Main sequence stars fuse _____ into _____ in their cores.
- c. The maximum mass for a white dwarf (~1.4 solar mass) is known as the _____.
- d. Stars burning helium-4 into carbon-12 in the triple-alpha process reside on what part of the H-R diagram? _____.
- e. A class of variable stars that have a relationship between their period and luminosity are known as _____.
- f. Supernovas with strong Hydrogen lines in their spectra are what type of supernova? _____.
- g. A white dwarf is supported by what force? _____.
- h. When the remaining matter in a star collapses beyond the Schwarzschild radius, it forms a _____.
- i. Pulsars emit radiation most strongly in what wavelength band? _____.
- j. This exploration mission successfully landed on Mars in August 2012. _____.

4. Vega is the brightest star in the constellation Lyra. It has a parallax angle of 130.23 mas.

- a. What is the distance to Vega? (*pc OR ly OR m*) (2)

b. Vega is historically the zero point of the apparent magnitude system. What is its absolute magnitude? (*magnitudes*) (3)

c. Imagine that Vega magically replaces the Sun in our solar system. What is its apparent magnitude? Compare to the Sun. Why might this number not be what you expect? (*magnitudes*) (10)

5. The period-luminosity relationship for Type II Cepheids in the J-band is

$$M_J = -2.23 \log P - 0.864$$

a. Use the following to calculate the distance to the globular cluster M14. (*pc OR ly OR m*) (10)

| Star | Period (d) | m_J |
|------|------------|-------|
| A | 18.743 | 11.83 |
| B | 2.794 | 13.65 |
| C | 13.599 | 12.24 |
| D | 1.890 | 13.98 |

b. The actual distance to M14 is 9.3 kpc. Why might the value that you found be different? (5)

6. Quick Identification (20 points, 4 per object)

| Object | Name(s) | Wavelength band(s) |
|--------|---------|--------------------|
| A | | |
| B | | |
| C | | |
| D | | |
| E | | |
